

In **Kindergarten**, instructional time should focus on six core ideas:

ESS

- 2. Earth's Systems
- 3. Earth and Human Activity

LS

- 1. From Molecules to Organisms: Structures and Processes

PS

- 1. Matter and its Interactions
- 2. Motion and Stability
- 3. Energy

A quick guide for observing classroom content and practice

In a **Kindergarten classroom** science content may be integrated in a variety of ways. Science and engineering practices may also be incorporated throughout a number of centers, themes, and experiences. When observing science in a Kindergarten classroom, you should see students engaged with at least one science concept and one practice:

Science and Engineering Practices

- Asking questions and defining problems
- Developing and using models
- Planning and carrying out investigations
- Analyzing and interpreting data
- Using mathematics and computational thinking
- Constructing explanations and designing solutions
- Engaging in argument from evidence
- Obtaining, evaluating, and communicating information

Science Concepts

Earth and Space Science (ESS2, ESS3)

- Using and sharing quantitative observations of weather to describe patterns.
- Constructing an argument supported by evidence for how plants and animals can change the environment.
- Obtaining and using information about weather forecasting to prepare for, and respond to, different types of local weather.
- Communicating solutions to reduce the amount of natural resources an individual uses.

Life Science (LS1)

- Observing and communicating that animals and plants have needs to survive.
- Recognizing that all plants and animals grow and change over time.

Physical Science (PS1, PS2, PS3)

- Investigating and communicating the idea that different kinds of materials can be a solid or liquid depending on temperature.
- Comparing the effects of different strengths or directions of pushes and pulls on the motion of an object.
- Making observations to determine that sunlight warms materials on the Earth's surface.
- Using tools and materials to design and build a model of a structure that will reduce the warming effect of sunlight on an area.

NOTES

Comments on the Science and Engineering Practices:

- For a list of specific skills, see the *Science and Engineering Practices Progression Matrix* (www.doe.mass.edu/stem/review.html).
- Practices are skills **students** are expected to learn and do; standards focus on some but not all skills associated with a practice.

Science What to Look For The example below features three Indicators from the [Standards of Effective Practice](#). These Indicators are just a sampling from the full set of Standards and were chosen because they create a sequence: the educator plans a lesson that sets clear and high **expectations**, the educator then delivers high quality **instruction**, and finally the educator uses a variety of **assessments** to see if students understand the material or if re-teaching is necessary. This example highlights teacher and student behaviors aligned to the three Indicators that you can expect to see in a rigorous kindergarten classroom.

| | | |
|---|--|--|
| Expectations (Standard II, Indicator E) | Plans and implements lessons that set clear and high expectations and also make knowledge accessible for all students. | |
| Instruction (Standard II, Indicator A) | Uses instructional practices that reflect high expectations regarding content and quality of effort and work; engage all students; and are personalized to accommodate diverse learning styles, needs, interests, and levels of readiness. | |
| Assessment (Standard I, Indicator B) | Uses a variety of informal and formal methods of assessments to measure student learning, growth, and understanding to develop differentiated and enhanced learning experiences and improve future instruction. | |
